Accessibility Questions

- What corrections did you have to make, and how did you make them?
  - I had to add dynamic alt-text in the JS file so that alt tags matched the image displayed for each artist and album cover. I also had to add lang=en to the top of my HTML document and aria-tags to the buttons.
- Is this interface functional without the use of a mouse (i.e., just using keyboard keys)? Why or why not?
  - The interface is mostly functional without the use of a mouse, except that you have to tab through ALL the albums before being able to interact with the footer (so you need to tab through everything in order to pause the music).
- What are other accessibility tests or features you added or would be interested in learning about?
  - I'm interested in learning more about how screenreaders work and how people with eyesight challenges interact with them. Also I've been reading about fonts that make it easier for people with dyslexia to read (like bolding the first three letters of every word, etc.) and I'm curious to know if those types of things are actually helpful! If I have time, I'd like to have a dyslexia-mode toggle button on my final project.
